

Diamond

Visual Scripting for Unity
Script Generation Location

Don't Generate same scripts at different paths

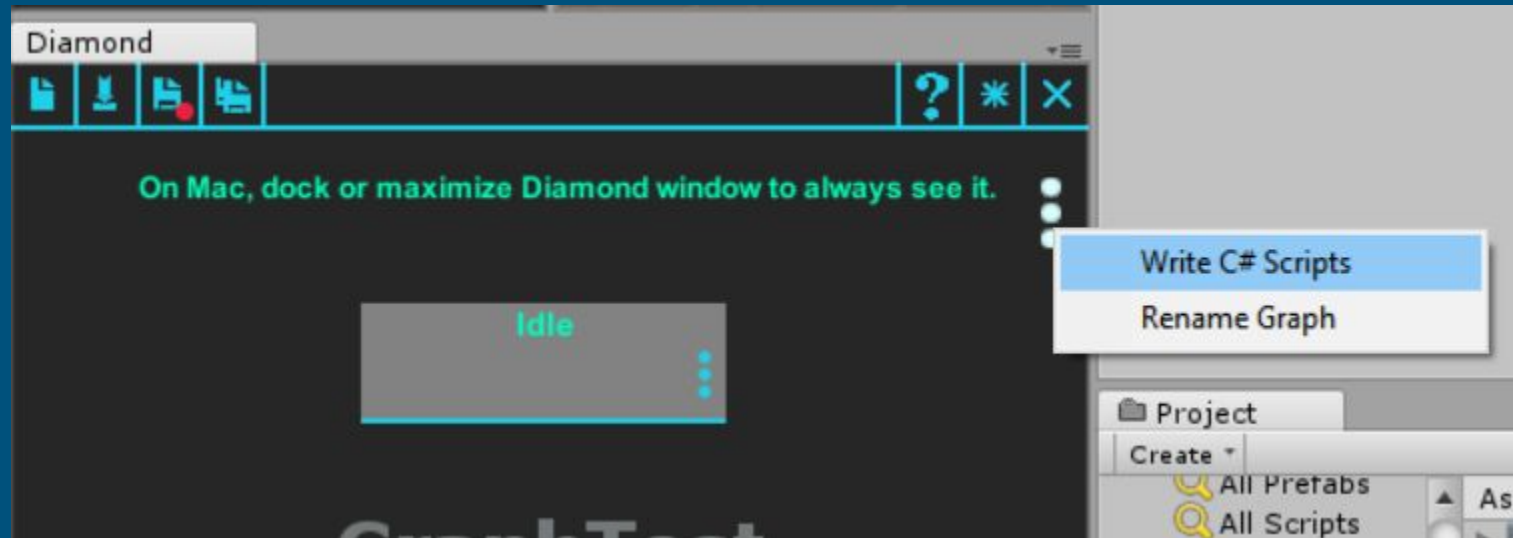

www.mezanix.com

Generate your C# scripts

You can generate your scripts by clicking the options button of your graph (top right).

[Return to slide](#)

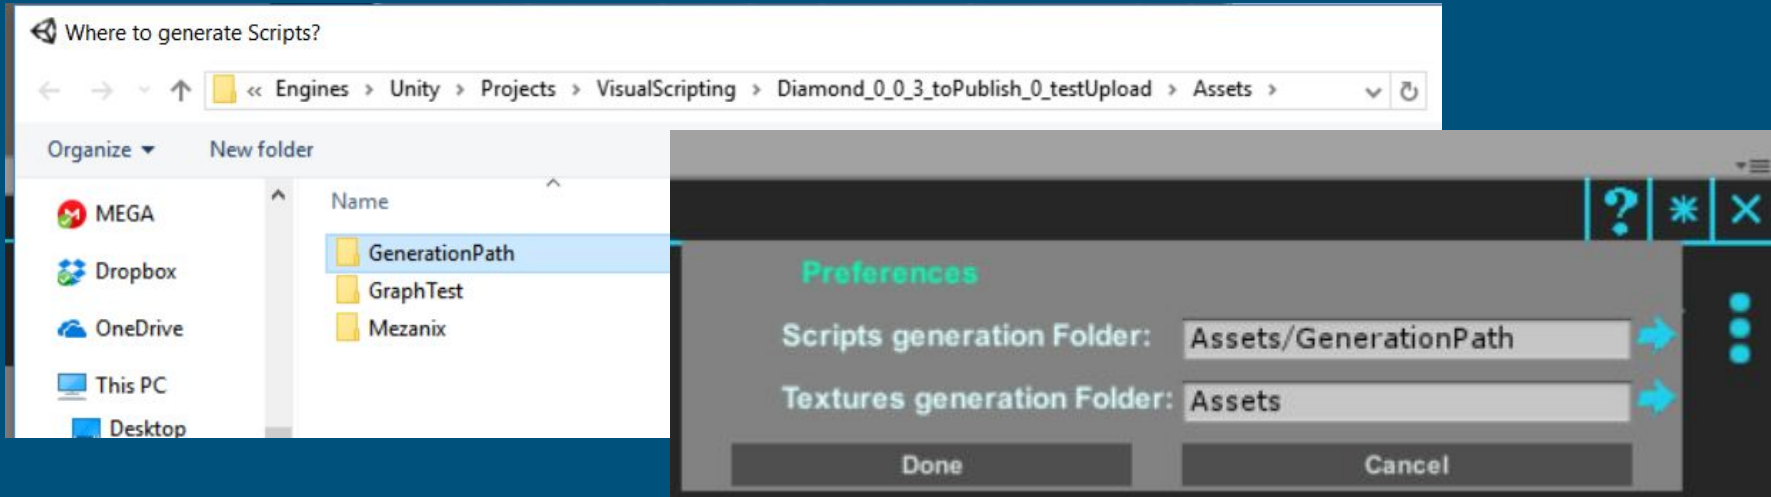

Generate your C# scripts, where ?

If you want to select a path for your scripts generations, click the preferences asterix (top right), click the blue arrow at the right and a explorer / finder window will open asking to select the scripts generation path

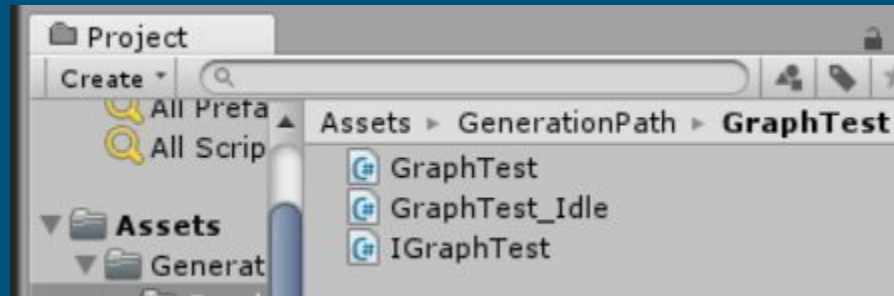

Generate your C# scripts, where ?

Inside the project I created a folder called “GenerationPath” and selected it. You can select any folder in your project. Last and not least, click Done to close menu and save the preferences.

Generate your C# scripts, where ?

Now generate your scripts (like [slide](#)). Scripts are generated in the desired path but we have an error saying that we have already a definition of our classes.

Generate your C# scripts, where ?

In this example I have already generated the scripts for the same graph in another folder.

We haven't the right to create 2 classes with the same name in the same namespace in a C# solution.

So if you want a new path to your scripts, simply delete the old ones and ask Diamond to generate your new scripts at the new path. If your script is already attached to a gameobject, after modifying its path, you need sometimes to reattach it.
